

Phishing Awareness - CodeAlpha Internship

Task 1

What is Phishing?

Phishing is a cyber attack in which attackers pretend to be trusted organizations or individuals to steal sensitive information such as passwords, bank details, or personal data.

Common Types of Phishing

1. Email Phishing

Fake emails that appear to come from legitimate organizations such as banks, social media platforms, or online services.

2. SMS Phishing (Smishing)

Fraudulent text messages containing malicious links or requests for personal information.

3. Website Phishing

Fake websites designed to look like genuine websites in order to steal login credentials and other sensitive data.

How to Identify Phishing Attempts

- Check the sender's email address carefully.
- Look for spelling and grammar mistakes.
- Hover over links to verify the actual URL before clicking.
- Be cautious of urgent or threatening messages.
- Never share passwords, OTPs, or personal information through email or messages.

What to Do If You Receive a Phishing Message

- Do not click on suspicious links.
- Do not download unknown attachments.
- Delete the message immediately.
- Report the phishing attempt if possible.
- Change your password if you accidentally shared any information.

Conclusion

Phishing attacks are one of the most common cybersecurity threats. By staying alert and following basic security practices, users can protect themselves from online scams and data theft.
